SARS CoV 2 (COVID 19) ANTIBODIES

(Method: Roche, Electrochemiluminescence (Total),
Immunochromatographic (IgG))

SARS CoV-2 (COVID-19) Antibody Total

65.31

COI

< 1.0 : NEGATIVE

> 1.0 : POSITIVE

SARS CoV-2 (COVID-19) Antibody IgG

POSITIVE

Antibody Assay for SARS-CoV-2 is not a diagnostic test to determine if COVID-19 virus is present. That diagnosis should be based on a PCR (molecular) test.

SARS CoV-2 (COVID-19) TOTAL ANTIBODIES: Test detects all COVID-19 related antibodies (IgA, IgM and IgG).

Antibody Test for IgG:

Positive test result detects IgG antibodies that develop in most patients within 7 to 10 days after symptoms of COVID-19 begin. SARS-CoV-2 antibody is indicative of an acute or recent infection. A positive result may also be due to past or present infection with non-SARS-CoV-2 coronavirus strains, such as coronavirus hKU1, NL63, OC43 or 229E that cause a mild illness like the common cold.

Negative test result with the Antibody Assay for SARS-CoV-2-specific antibodies does not rule out a SARS-CoV-2 infection. Patients tested early in the infection may have a negative result, **and not all patients will develop a detectable antibody response to SARS-CoV-2 infection.**

*** Roche serology test has a specificity greater than 99.8% and sensitivity of 100% (14 Days post-PCR confirmation)
